

# ESTIMATOR container repair information made easy

ESTIMATOR is a highly sophisticated solution designed to automate and speed up the collection and processing of container repair information.

Detailed repair data is quickly and accurately collected via hand-held PDAs which can be operated in any weather conditions and which eliminate the need for handwritten estimates and subsequent re-keying in of data.

## ESTIMATOR offers your operation a host of benefits...

Information is entered into the ESTIMATOR terminal, without the need to know specific repair codes, by simply pointing to the relevant items on the terminal's screen.

Information is displayed and entered utilising standard container terms selected from a series of drop down menus, thus making the system both easy to learn and to use and, most importantly, reduces the need for a keyboard. Once repair information is collected it is then downloaded to a standard PC for subsequent costing and processing.

Estimator's multiple levels of damage entry ensures a precise description of the required repair without the need to know coding structures. The use of ISO codes is available without the need to learn lengthy lists.

Because information is collected directly into a computer terminal and all following processes are automatic, it totally eliminates any keying and re-keying requirements thus reducing errors and manual intervention considerably.

Based on Windows Pocket PC, Estimator is written using Microsoft C# .Net technology. If the PDA has GPRS capability ESTIMATOR communicates directly with Ideal's UNITRACK-D container control solution via the Internet, so there is no need to return to a central point for uploading and downloading of data.

All costings are processed when the data is transferred back to UNITRACK-D, thus saving on the amount of processing power and time consuming setups of each PDA.

Point and touch technology makes ESTIMATOR a simple and user-friendly estimating tool.
