

REEFER refrigerated container monitoring and reporting

REEFER is a recording system designed to monitor and provide reports on temperature checks and inspections whilst a refrigerated container (reefer) is plugged in within a container storage facility.

REEFER is one of the suite of software solutions developed by Ideal Business Services Ltd for the logistics and distribution industries.

Makes REEFER monitoring easy...

REEFER is an easy to use module consisting of:

- Plug in request
- Temperature check request
- Inspection request
- Unplug request

"all actions are historically recorded against the container number"

Each request produces a job note to the engineer for the action to be taken. All actions are historically recorded against the container number and can be recalled at any time using either an enquiry screen of activity report.

Request for plug in produces a job note for the engineer. Each note is given a unique ID and retained within the system. Each action resulting from the requests is fed into the system. Each action is given a unique id and retained against the container record for historical purposes.

REEFER operates on industry standard Microsoft and PC hardware/software platforms in a Client/Server environment:

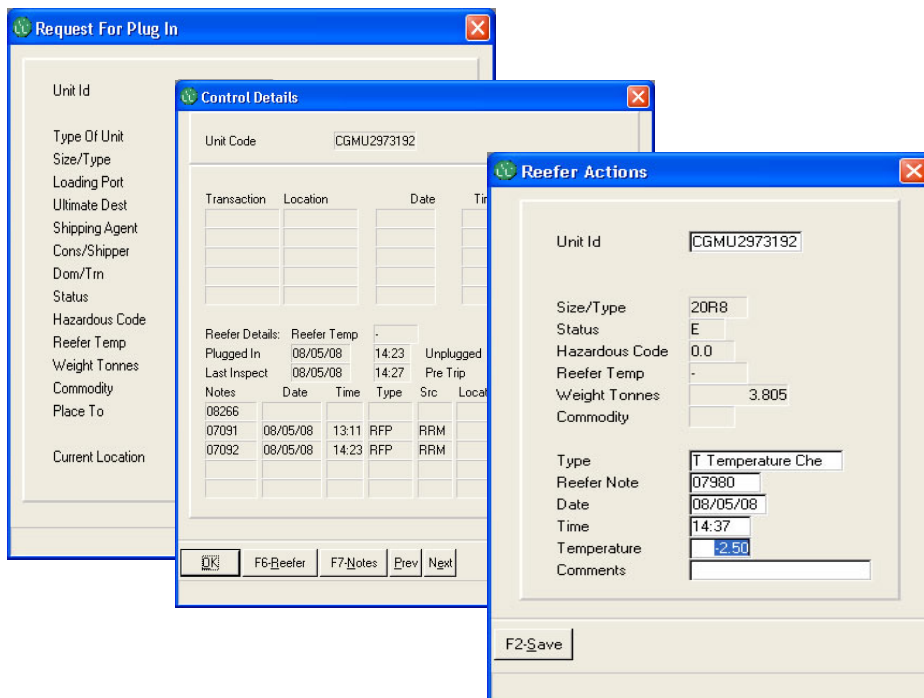

Server

Microsoft Windows 2000/2003
Linux
IBM UniData/NT Multi-dimensional Relational Database System Builder/NT 4th Generation Application Generator

Client

Microsoft Windows 98 or XP
SB Client

All functions are fully integrated and utilise on-line processing techniques, including features such as immediate data validation.
